

The rollover button that we had made in class was basically two pictures in Photoshop. I have made animations before and am pretty knowledgeable on how to make them. All I really needed to do to this image was to make the boxes appear one after the other. At first I having small issues on how to use the code in which would make the process work. I had to saved files in PhotoShop which I had saved as a .PNG file. I used the code provided and replaced it with my personal sources. (Meaning the two file I was using.) At first the code didn't work the way I had put it. I noticed after lengthy time and looking into it that I had misspelled one single word from my source and left out a quotation mark. This lead to my Button NOT to work. This I assumed was do to the fact that the computer could not read the code properly and allow it to run within the program FRONTPAGE which was the program I had used to create my HTML site or single paged web page. I pasted the code with my two source files first my "start" image below on the left. Then my "roll" image on the bottom right. When your cursor "hovers" over my image in the HTML page it shifts into the image on the right side.

This is my initial image of the unicorn used as my start image.

My image changes from the one seen on the left to the one on the right when your cursor goes over it

This is my end result of the unicorn placing in it the rainbow and my name.
